# 1 PURPOSE

---

The purpose of this data set specification (DSS) is to support a comprehensive surveillance program of healthcare associated infections (HAI).

This DSS supports consistent local collection of healthcare associated infection (HAI) data, and embeds national definitions for key elements.

This DSS is intended to promote and support consistent collection of reliable, comparable HAI surveillance data.

It is recommended that local forms and systems, and jurisdictional or ownership group data collections adhere to these national health information standards.

This DSS was presented to the National Health Information Statistical Standards Committee (NHISCC) in March 2012, for national endorsement.

## 2 BACKGROUND

---

In December 2008, Australian Health Ministers' Conference (AHMC) endorsed the following recommendations:

- a. All hospitals establish healthcare associated infection (HAI) surveillance
- b. All hospitals monitor and report through their relevant jurisdiction
  - i. *Staphylococcus aureus* (including methicillin-resistant (MRSA)) blood stream infections
  - ii. *Clostridium difficile* infections (CDI)

In addition, *Staphylococcus aureus* bacteraemia (SAB) rates are one of the National Health Care Agreement Performance Indicators, announced in November 2008<sup>1</sup>, and Health Ministers endorsed routine monitoring by hospitals of HAI SAB and CDI in November 2008, as two of the core, hospital-based outcome indicators of safety and quality<sup>2</sup>.

National surveillance requires common definitions and consistent data collection processes. However, at the time of these ministerial decisions, there was no systematic Australia-wide approach to the measurement of patient harm caused by or associated with HAI.

### HAI and patient safety

Healthcare associated infections (HAIs) are those infections that are not present or incubating at the time of admission to a hospital or healthcare facility; develop within a healthcare facility; or, are produced by micro-organisms acquired during admission.

HAI is responsible for a significant burden of iatrogenic morbidity and mortality. Each year in Australia there are about 200,000 HAIs<sup>3</sup>.

HAIs cause patients pain and suffering, prolong hospital admissions and cause significant harm to patients. Some patients die as a result of HAIs, many of which are preventable. Prevention of HAI is the responsibility of all who care for patients, and can cost less than treating such infections. Infection has moved from being considered an unpredictable 'complication' to being considered a potentially preventable 'adverse event'.

### *Staphylococcus aureus* bacteraemia (SAB)

Studies in Australia document that 17–29% of patients with hospital-acquired bloodstream infections (BSIs) die while still in hospital. Patients who develop BSIs are also more likely to suffer complications during their hospital stay that result in a longer hospital stay and an increased cost of hospitalisation<sup>3</sup>

*Staphylococcus aureus* is the most common cause of healthcare associated BSIs, causing significant illness and death; more than half of these infections are associated with health care procedures<sup>4</sup>, and are thus potentially preventable<sup>5</sup>.

<sup>3</sup> Cruickshank M, Ferguson J, editors. Reducing Harm to Patients from Healthcare associated Infection: The Role of Surveillance: Australian Commission on Safety and Quality in Health Care, 2008.

<sup>4</sup> Each year in Australia, there are likely to be more than 12,000 BSIs associated with health care, of which 7,000 are *Staphylococcus aureus* bacteraemias. Cruickshank M, Ferguson J, editors. Reducing Harm to Patients from Healthcare associated Infection: The Role of Surveillance: Australian Commission on Safety and Quality in Health Care, 2008

*Clostridium difficile* infection (CDI)

*Clostridium difficile* infection (CDI), also known as *Clostridium Difficile* Associated Disease (CDAD), remains the single most frequently occurring HAI in hospitals in developed countries<sup>6</sup>. Almost all cases follow the use of antibiotics, and the major reservoir of infection is infected patients in hospitals or long-term care facilities. *Clostridium difficile* infection is found in the stool of 15–25% of patients with antibiotic-associated diarrhoea and more than 95% of patients with pseudomembranous colitis (PMC).<sup>3</sup> CDI has a significant impact on modern health care. International studies show that infected patients spend an extra 1–3 weeks in hospital, costing €5000–15,000 per case<sup>7</sup>.

The main reasons for establishing surveillance of CDI were that higher rates can be attributed to the overuse of antibiotics, ineffective infection control processes such as poor levels of hand hygiene and environmental cleanliness, and to have an early warning system for severe strains of CDI already present in Europe and North America, which have significantly higher morbidity and mortality than the strains being detected at the time of the AHMC determination in 2008.

## 3 SURVEILLANCE

---

The Healthcare associated infection datasets for surveillance of *Staphylococcus aureus* bacteraemia (SAB) and *Clostridium difficile* infection (CDI) are designed for the purposes of infection surveillance, not diagnosis. The value of surveillance as part of a hospital infection control program is supported by high-grade international and national evidence.

Surveillance data should be used to identify local problem areas and implement appropriate policy and clinical interventions to improve the quality of care, not for external benchmarking. Effective surveillance systems provide the impetus for change and make it possible to evaluate the effectiveness of interventions. An effective surveillance system is one that provides timely information to hospital managers and clinicians to promote action for health.

Surveillance is an important tool to reduce HAI. The purpose of collecting, analysing, and then acting on reliable surveillance data is to improve quality and patient safety within a service or facility or jurisdiction. Effective surveillance systems provide the impetus for change and make it possible to evaluate the effectiveness of interventions.

To significantly reduce *Staphylococcus aureus* (including MRSA) blood stream infection and other HAI, a multifaceted approach is required. This approach can be grouped into specific strategies at hospital / healthcare facility, jurisdictional and national level supported by generic tools including surveillance.

### **HAI Surveillance in Hospitals**

Local data collections must provide timely and reliable feedback for clinicians to effectively manage HAI. They should also inform local prevention strategies and improvement strategies. This data set supports the case definitions of SAB and CDI endorsed at the January 2009 Inter-jurisdictional Committee meeting (convened by the Australian Commission on Safety and Quality in Healthcare) and should be collected in Australian hospitals.

### **HAI Surveillance at State/Territory Level or private hospital ownership group**

When surveillance information is collated and analysed at jurisdictional or ownership group level, it:

- informs policy, resource allocation and programs;
- should be returned to hospitals for benchmarking and comparison;
- should be used as the basis for liaison between health services and infectious disease experts to develop state-based priority programs to reduce HAI; and
- enables monitoring of jurisdictional or ownership group trends related to HAI.

### **Further development**

Further work is planned for a national approach to HAI surveillance. For guidance on HAI surveillance, refer to the companion documents to this data set specification, the Implementation Guidelines for surveillance of SAB and CDI, which are available on the Commission's website at

<http://www.safetyandquality.gov.au/internet/safety/publishing.nsf/Content/PriorityProgram-03>

## 4 KEY CONCEPTS

### 4.1 Core data sets

This data set specification is intended to support a minimum standard of *Staphylococcus aureus* (SAB) bloodstream infection and *Clostridium difficile* (CDI) infection surveillance in Australian acute care hospitals by defining the core data sets for healthcare associated infections: SAB and CDI.

The scope of the data sets are cases of SAB and CDI healthcare associated infections that arise from an episode of patient care in an Australian hospital and meet the case definition. For SAB definition see page 12, and for CDI definition see page 15.

In order for jurisdictions and private hospital ownership groups to accurately report and monitor Healthcare Associated Infections (HAIs), the data elements listed in Table 1 should be collected at hospital level for each patient-episode of *Staphylococcus aureus* bacteraemia, and hospital identified *Clostridium difficile* infection.

## 4.2 Case definition - Healthcare Associated *Staphylococcus aureus* bacteraemia (SAB)

A patient-episode of *Staphylococcus aureus* bacteraemia (SAB) is a positive blood culture for *Staphylococcus aureus*.

For surveillance purposes, only the first isolate per patient is counted, unless at least 14 days has passed without a positive culture, after which an additional episode is recorded.

A SAB will be considered to be a **healthcare-associated** event if:

### EITHER

**CRITERION A.** The patient's first SAB positive blood culture was collected **more than 48 hours after** hospital admission or **less than 48 hours after** discharge.

### OR

**CRITERION B.** The patient's first positive SAB blood culture was collected **less than or equal to 48 hours after hospital admission and one or more of the following key clinical criteria** was met for the patient-episode of SAB:

1. SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter)
2. SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site
3. SAB was diagnosed within 48 hours of a related invasive instrumentation or incision
4. SAB is associated with neutropenia (less than  $1 \times 10^9$  L) contributed to by cytotoxic therapy

If none of these criteria are met, then the episode of SAB is considered to be community associated for the purposes of surveillance. See Figure 1 for flowchart.

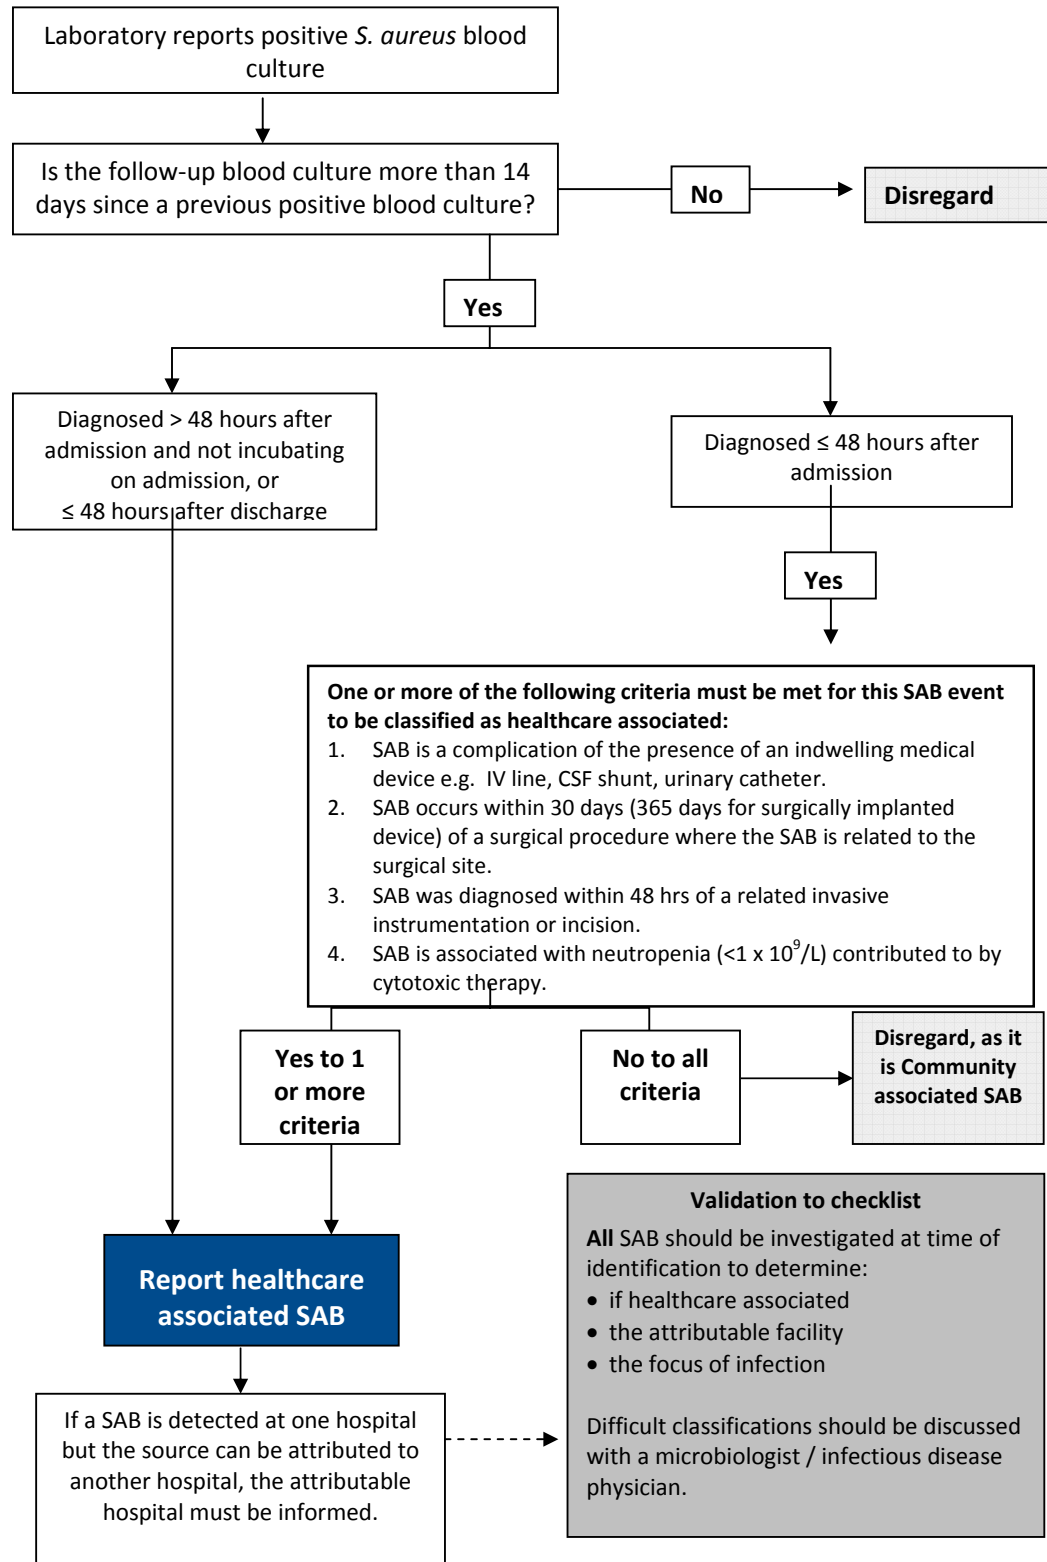

Note: Cases where a known previous positive test has been obtained within the last 14 days are excluded.

For example: If a patient has SAB in which 4 sets of blood cultures are positive over the initial 3 days of the patient's admission only one episode of SAB is recorded. If the same patient had a further set of positive blood cultures on day 6 of the same admission, these would not be counted again, but would be considered part of the initial patient-episode.

Note: If the same patient had a further positive blood culture 20 days after admission (i.e. greater than 14 days after their last positive on day 5), then this would be considered a second patient-episode of SAB.

Surveillance of Healthcare Associated Infections: SAB and CDI

Figure 1 – Flow Chart – Determining whether *Staphylococcus aureus* bacteraemia is Healthcare associated

### 4.2.1 Calculation of SAB rates

The following primary information will be used to define the rates of *Staphylococcus aureus* bacteraemia (SAB) for each Australian healthcare facility with acute inpatient beds:

#### Numerator

- Patient-episodes of SAB (noting the following factors related to each episode):
  - Determination of whether the SAB is a healthcare associated infection
  - Designation of which healthcare facility the patient was admitted to at the time of the patient-episode of SAB

#### Denominator

- Total patient days (noting the following inclusion)
  - Same-day patients

The rate will be calculated for each healthcare facility and State/Territory as follows:

Numerator: Patient episodes of Healthcare associated SAB x 10,000  
Denominator: Number of patient days

### 4.2.2 Notes – SAB Calculation

#### Patient days

The recommended denominator for calculating rates of HAI in Australian healthcare facilities is *patient days*. *Patient days* is a national standard, defined in the national health data dictionary and used for national reporting. *Occupied bed days* is a term commonly used by some states to express a similar concept to *patient days*. However, there is no national standard for calculating *occupied bed days*.

*Patient days* are calculated by counting the total patient days of those patients *separated* during the specified period, including those admitted before the specified period. Patient days of those patients admitted during the specified period who did not separate until the following reference period are not counted.

For example, Patient A is admitted on January 20 and discharged February 20. Patient A generates 0 patient days in the hospital's January record, and 31 patient days for February (11 from the January period of the separation, and 20 in February).

The yearly variance between calculations of *patient days* and *occupied bed days* is minimal (less than 1%); however the monthly variation can be quite significant for smaller hospitals.

Contract patient days are included in the count of total patient days. If it is a requirement to distinguish contract patient days from other patient days, they can be calculated by using the rules contained in the data element: total contract patient days.

#### Contamination

A contaminated specimen can produce a false positive in surveillance systems. Contamination of blood cultures is rare in adults (1- 2% of culture positive episodes) and more common in children (5-10%). If, in the evaluation of a potential event, the clinical diagnosis is unresponsive of infection AND, either a repeat blood culture(s) is (are) negative, AND/OR no antimicrobial

treatment is given, the positive blood culture should be regarded as a contamination and not reported in the surveillance data.<sup>8</sup>

### 4.3 Case Definition - Hospital identified *Clostridium difficile* infection (CDI)

A CDI case is defined as a case of diarrhoea that meets the following criteria

- the stool sample yields a positive result in a laboratory assay for *C. difficile* toxin A and/or B, or
- a toxin-producing *C. difficile* organism is detected in the stool sample by culture or other means.

A hospital identified CDI case is:

- a CDI case diagnosed in a patient attending a hospital (that is, it includes positive specimens obtained from admitted patients and those attending the Emergency Department, and outpatient departments).

#### Exclusions

- Cases where a known previous positive test has been obtained within the last 8 weeks (that is, only include cases once in an 8 week period).
- Patients less than two years old at date of admission.

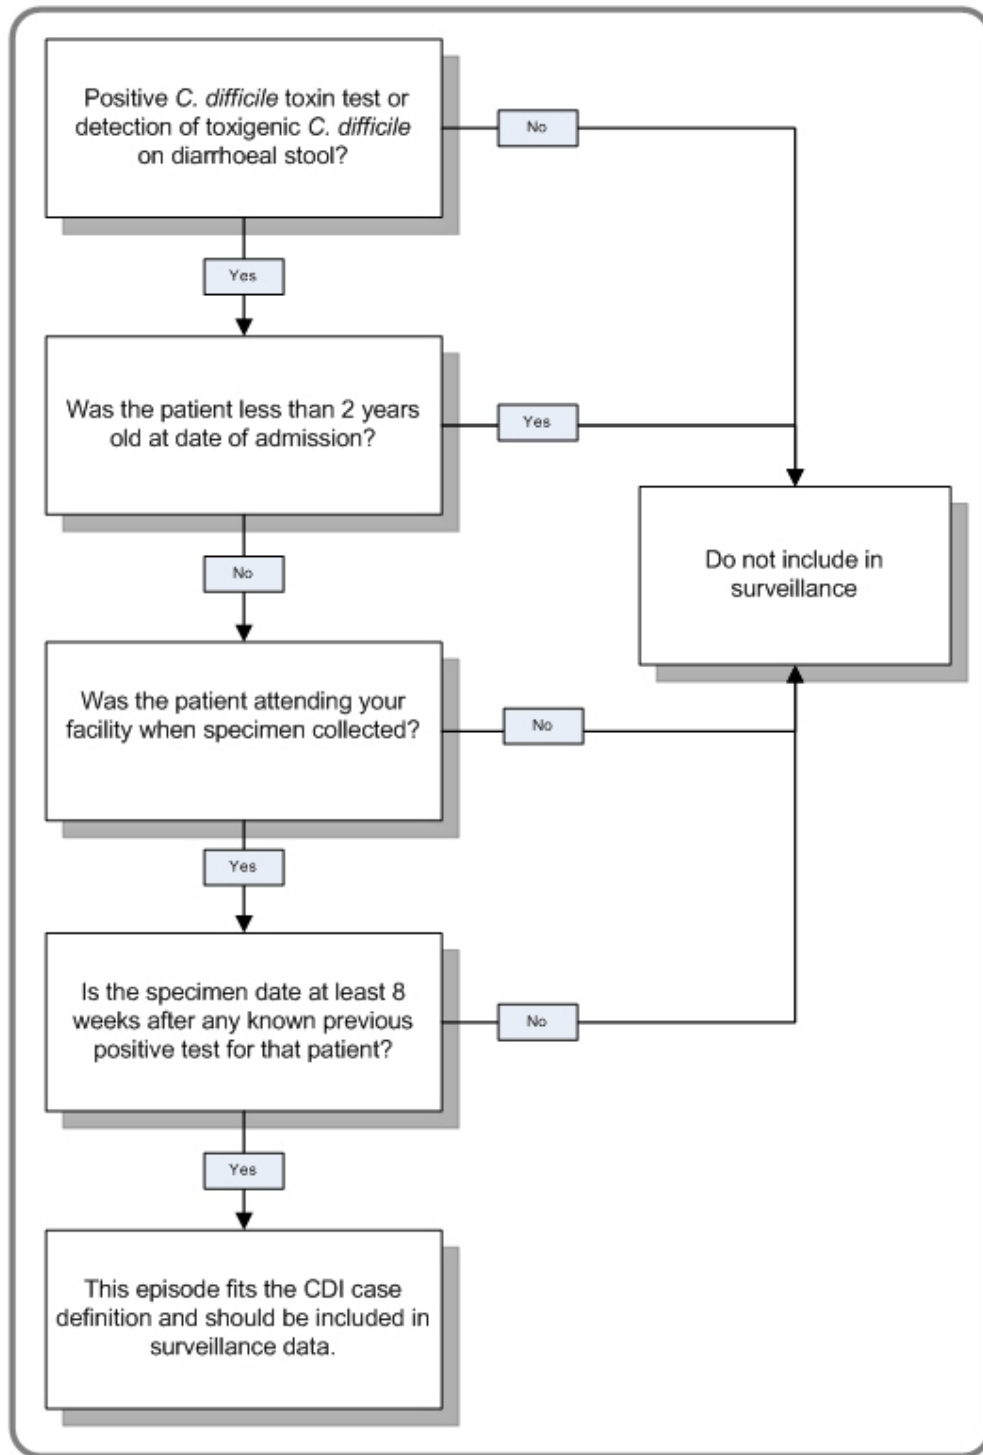

Note: An additional positive test obtained from a specimen collected from the same patient more than 8 weeks since the last positive test is regarded as a new case.

See Figure 2.

---

<sup>8</sup> Hunter Area Pathology Service: internal data 2005-9. Personal communication Dr J Ferguson  
[http://www.asid.net.au/hicsigwiki/index.php?title=Rates\\_of\\_blood\\_culture\\_contamination\\_with\\_Staphylococcus\\_aureus](http://www.asid.net.au/hicsigwiki/index.php?title=Rates_of_blood_culture_contamination_with_Staphylococcus_aureus)

Figure 2 – Flow chart – Determining whether the C.difficile infection meets the case definition for hospital identified CDI

### 4.3.1 Calculation of hospital identified CDI rates

Principles of *Clostridium difficile* infection prevention include antibiotic stewardship, monitoring of incidence and outbreaks, appropriate use of contact precautions, accurate identification of infected patients, consistent hand hygiene and improved environmental cleaning.

The rate of CDI is an important indicator of safety and quality, and CDI is the object of national surveillance. Recently published international recommendations and a national definition support implementation of an appropriate surveillance program in Australia.<sup>3</sup>

The following primary information will be used to calculate the rates of *C. difficile* infection (CDI) in each Australian healthcare facility with acute inpatient beds.

#### Numerator

- Patient episodes of hospital identified CDI (total hospital CDI cases)

#### Denominator

- Total patient days (including day cases)

#### **Exclusions**

- Cases where a known previous positive test has been obtained within the last 8 weeks (that is, only include cases once in an 8 week period)
- Patients less than 2 years old at date of admission

This will be calculated for each hospital as follows:

Numerator: Patient episodes of hospital identified CDI x 10,000  
Denominator: Number of patient days

Note: Rates for healthcare facilities can be aggregated to produce rates for each state / territory.

### 4.3.2 CDI and cases of severe disease

The *C. difficile* case definition does not require differentiation between severe and non-severe cases.

A severe case is defined as a CDI case patient who meets any of the following surveillance criteria within 30 days of symptom onset:

- history of admission to an intensive care unit for treatment of complications from CDI (for example vasopressor therapy for shock);
- history of surgery for treatment of toxic megacolon, perforation or refractory colitis; or
- death caused by CDI within 30 days of symptom onset.

---

<sup>3</sup> Cruickshank et al, op cit, p. 171

### 4.3.3 Calculation of rates of severe CDI

For those healthcare facilities or organisations monitoring severe disease, this should be expressed as the proportion of total hospital identified CDI cases in the reporting period that were severe against the total number of CDI cases in the reporting period. The raw numbers as well as the proportion should be reported to aid interpretation.

The proportion should be calculated for each healthcare facility in the reporting period, as follows:

Numerator: Patient episodes of hospital identified CDI - severe disease  
Denominator: Patient episodes of hospital identified CDI (total hospital CDI cases)

### 4.4 Levels of Identification

Whenever data regarding individuals or service provider organisations are collected or disseminated, privacy and confidentiality must be addressed. Hospitals, health services and jurisdictions have a range of policies, regulations and laws in place regarding the use of personal health information for secondary purposes. This data set specification does not address health information privacy in detail.

However, the following principles can be applied to HAI surveillance in general:

- Hospitals can and will hold identified data on healthcare associated infections.
- Jurisdictions and private hospital ownership groups will focus on trends over time and variation between comparable facilities, and do not necessarily need to hold identified patient information<sup>10</sup>.
- National reporting will focus on trends over time and regional variation

No individual service provider or individual client will be identified/or identifiable in any published reporting undertaken comprising healthcare associated infections data.

Data collection staff must be made aware of the need for ethical management and privacy of data. Generally, clients should be informed as to what information is collected, by whom, how it will be used, and their rights in relation to it. This should occur, irrespective of whether the information was collected from a third party or directly from the person concerned. The *Privacy Act 1988*, however, recognises there will be situations when it is not reasonable or appropriate to do this.

The datasets for *Staphylococcus aureus* bacteraemia and *Clostridium difficile* infection are structured in the following layers:

- Episode and person level data (SAB/CDI patient episode and demographics)
- Establishment level data (hospital and laboratory)
- Disease specific data (to calculate rates)

---

<sup>10</sup> However, HAIs are notifiable in some jurisdictions

Figure 4 – Levels of reporting

<b>Hospital</b>		
<b>Episode and person data</b>	<b>Jurisdiction or Ownership group</b>	
Establishment level data	Establishment level data	<b>National reporting</b>
Disease specific data	Disease specific data (by facility)	Disease specific data (by Jurisdiction)

#### 4.5 Metadata standards and data elements

The development of metadata standards improves quality, relevance, consistency and the availability of national information about the health and welfare of Australians. The drivers for standard development arise from the need for better information - whether it is statistical, administrative, clinical or other information.

Metadata standards describe the expected meaning and acceptable representation of data for use within a defined context. The need for consistency of meaning is vital to facilitate information sharing among primary and secondary users of the data. Much of the work involved in establishing a data collection is in the development of metadata standards to ensure comparability and consistency of the data collected and produced from the collection. The data standards in this data dictionary are based on the national health standard used by METeOR, Australia's repository for national metadata standards for the health, community services and housing assistance sectors. The system was developed by the Australian Institute of Health and Welfare and is accessed online via <http://meteor.aihw.gov.au/>.

**Note:**

The format of the data elements section of this document is based on the METeOR standard. *METeOR is Australia's repository for national metadata standards for the health, community services and housing assistance sectors*<sup>11</sup>.

In order to support the use of this Data Set Specification (DSS) by those working in the area of HAI surveillance and surveillance system development, the data element presentation in this specification is a truncated version of the METeOR standard. A fully compliant version will be maintained within the national metadata registry, METeOR.

<sup>11</sup> See <http://meteor.aihw.gov.au/content/index.phtml/itemId/181414>

## **5 DATA ELEMENTS – PATIENT EPISODE OF HEALTHCARE ASSOCIATED INFECTION**

---

This section specifies the data elements to be collected at hospital level for all patient episodes of healthcare associated infection

- Admission date
- Separation date
- Specimen collection date
- Specimen collection time
- Establishment number
- Ward/clinical area
- Specimen identifier
- Laboratory result identifier
- Laboratory number

## 5.1 Admission date

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of admitted patient care—admission date, DDMMYYYY
<i>METeOR identifier:</i>	269967
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Date on which an admitted patient commences an episode of care.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Date
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	Assign the admission date for the patient-episode:  where the positive blood culture for <i>Staphylococcus aureus</i> bacteraemia has been isolated, and is considered to be a healthcare associated infection according to the case definition;  OR  where <i>Clostridium difficile</i> has been detected in the stool sample and is considered to be a healthcare associated infection according to the case definition.

## 5.2 Separation date

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of admitted patient care—separation date, DDMMYYYY
<i>METeOR identifier:</i>	270025
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Date on which an admitted patient completes an episode of care.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Date
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	Assign the separation date for the patient-episode:  where the positive blood culture for <i>Staphylococcus aureus</i> bacteraemia has been isolated, and is considered to be a healthcare associated infection according to the case definition;  OR  where <i>Clostridium difficile</i> has been detected in the stool sample and is considered to be a healthcare associated infection according to the case definition.
<i>Comments:</i>	There may be variations amongst jurisdictions with respect to the recording of separation date. This most often occurs for patients who are statistically separated after a period of leave (and who do not return for further hospital care). In this case, some jurisdictions may record the separation date as the date of statistical <b>separation</b> (and record intervening days as leave days) while other jurisdictions may retrospectively separate patients on the first day of leave. Despite the variations in recording of separation date for this group of patients, the current practices provide for the accurate recording of length of stay.

<i>Origin:</i>	ACSQHC Healthcare Associated Infection Technical Working Group

## 5.5 Establishment number

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment—organisation identifier (state/territory), NNNNN
<i>METeOR identifier:</i>	269975
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	An identifier for an establishment, unique within the state or territory.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Identifier
<i>Data type:</i>	Number
<i>Format:</i>	NNNNN
<i>Maximum character length:</i>	5

### Data element attributes

---

#### Collection and usage attributes

<i>Comments:</i>	<p>Identifier should be a unique code for the health care establishment used in that state/territory.</p> <p>This data element concept will be replaced by the NEHTA <i>Healthcare Provider Identifiers – Organisation (HPI-O)</i>. Information about the HPI-O is shown below. NEHTA has engaged Medicare Australia to design and build Australia's first national healthcare identification service, to provide the requisite identification service for the people and organisations involved in healthcare across Australia, by way of:</p> <ul style="list-style-type: none"><li>• <i>Individual Healthcare Identifiers (IHIs)</i> to identify all Australian healthcare consumers</li><li>• <i>Healthcare Provider Identifiers - Individual (HPI-Is)</i>, to identify individual healthcare providers, such as general practitioners, clinicians, nurses and pharmacists</li><li>• <i>Healthcare Provider Identifiers – Organisation (HPI-Os)</i>, to identify healthcare organisations such as hospitals and clinics.</li></ul> <p>Initially, it is assumed that the Individual Healthcare Identifiers (IHIs) and jurisdictional and local system identifiers (including Medical Record Numbers [MRNs] and Unique Patient Identifiers [UPIs]) will coexist. However, in the longer term, IHIs, HPI-Is and HPI-Os are expected to replace these existing, localised identifiers.</p>
------------------	--

## 5.6 Ward/clinical area

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment—ward/clinical area name, text X[X(39)]
<i>METeOR identifier:</i>	389201
<i>Registration status:</i>	Health, Standardisation pending 22/02/2012
<i>Definition:</i>	The organisational unit or organisational arrangement dedicated to the treatment and care of admitted patients in a healthcare setting, as represented by text.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Text
<i>Format:</i>	X[X(39)]
<i>Maximum character length:</i>	40

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	This data element refers to the ward or clinical area within the healthcare facility where the patient was located. This information will be facility specific, so local conventions for naming wards should be used, for example Maternity Ward, or Emergency Department.
-----------------------	--

#### Source and reference attributes

## **6 PERSON DATA ELEMENTS**

---

This section specifies the following person-level data elements:

- Family name
- Given name(s)
- Indigenous status
- Date of birth
- Sex
- Address line (person)
- Suburb/town/locality name (person)
- Australian postcode (address)
- Australian state/territory identifier (person)
- Person identifier

## 6.1 Family name

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person (name)—family name, text X[X(39)]
<i>Synonymous names:</i>	Surname; Last name
<i>METeOR identifier:</i>	286953
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Superseded 06/02/2012 Housing assistance, Standard 20/06/2005
<i>Definition:</i>	That part of a name a person usually has in common with some other members of his/her family, as distinguished from his/her given names, as represented by text.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Text
<i>Format:</i>	X[X(39)]
<i>Maximum character length:</i>	40

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	The agency or establishment should record the person's full <b>family</b> name on their information systems.
<i>Collection methods:</i>	See <a href="http://meteor.aihw.gov.au/content/index.phtml/itemId/286953">http://meteor.aihw.gov.au/content/index.phtml/itemId/286953</a> for collection methods if required.

## 6.4 Date of birth

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person—date of birth, DDMMYYYY
<i>METeOR identifier:</i>	287007
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 25/08/2005 Housing assistance, Standard 20/06/2005
<i>Definition:</i>	The date of birth of the person.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Date
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	<p>If date of birth is not known or cannot be obtained, provision should be made to collect or estimate age. Collected or estimated age would usually be in years for adults, and to the nearest three months (or less) for children aged less than two years. Additionally, an estimated date flag or a date accuracy indicator should be reported in conjunction with all estimated dates of birth.</p> <p>For data collections concerned with children's services, it is suggested that the estimated date of birth of children aged under 2 years should be reported to the nearest 3 month period, i.e. 0101, 0104, 0107, 0110 of the estimated year of birth. For example, a child who is thought to be aged 18 months in October of one year would have his/her estimated date of birth reported as 0104 of the previous year. Again, an estimated date flag or date accuracy indicator should be reported in conjunction with all estimated dates of birth.</p>
<i>Collection methods:</i>	<p>Information on date of birth can be collected using the one question: What is your/(the person's) date of birth?</p> <p>In self-reported data collections, it is recommended that the following response format is used: Date of birth: __ / __ / _____</p> <p>This enables easy conversion to the preferred representational layout (DDMMYYYY).</p> <p>For record identification and/or the derivation of other metadata items that require accurate date of birth information, estimated dates of birth should be identified by a date accuracy indicator to prevent inappropriate use of date of birth data. The linking of client records from diverse sources, the sharing of patient data, and data analysis for research and planning all rely heavily on the accuracy and integrity of the collected data. In order to maintain data integrity and the greatest possible accuracy an indication of the accuracy of</p>

*Surveillance of Healthcare Associated Infections: SAB and CDI*

the date collected is critical. The collection of an indicator of the accuracy of the date may be essential in confirming or refuting the positive identification of a person. For this reason it is strongly recommended that the data element Date—accuracy indicator, code AAA also be recorded at the time of record creation to flag the accuracy of the data.

*Comments:*

Privacy issues need to be taken into account in asking persons their date of birth.

Wherever possible and wherever appropriate, date of birth should be used rather than age because the actual date of birth allows a more precise calculation of age.

When date of birth is an estimated or default value, national health and community services collections typically use 0101 or 0107 or 3006 as the estimate or default for DDMM.

It is suggested that different rules for reporting data may apply when estimating the date of birth of children aged under 2 years because of the rapid growth and development of children within this age group which means that a child's development can vary considerably over the course of a year. Thus, more specific reporting of estimated age is suggested.

### Data element attributes

---

#### Collection and usage attributes

*Surveillance of Healthcare Associated Infections: SAB and CDI*

*Collection methods:*

Operationally, sex is the distinction between male and female, as reported by a person or as determined by an interviewer.

When collecting data on sex by personal interview, asking the sex of the respondent is usually unnecessary and may be inappropriate, or even offensive. It is usually a simple matter to infer the sex of the respondent through observation, or from other cues such as the relationship of the person(s) accompanying the respondent, or first name. The interviewer may ask whether persons not present at the interview are male or female.

A person's sex may change during their lifetime as a result of procedures known alternatively as sex change, gender reassignment, transsexual surgery, transgender reassignment or sexual reassignment. Throughout this process, which may be over a considerable period of time, the person's sex could be recorded as either Male or Female.

In data collections that use the ICD-10-AM classification, where sex change is the reason for admission, diagnoses should include the appropriate ICD-10-AM code(s) that clearly identify that the person is undergoing such a process. This code(s) would also be applicable after the person has completed such a process, if they have a procedure involving an organ(s) specific to their previous sex (e.g. where the patient has prostate or ovarian cancer).

CODE 3 Intersex or indeterminate

Is normally used for babies for whom sex has not been determined for whatever reason.

Should not generally be used on data collection forms completed by the respondent.

Should only be used if the person or respondent volunteers that the person is intersex or where it otherwise becomes clear during the collection process that the individual is neither male nor female.

CODE 9 Not stated/inadequately described

Is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

## 6.6 Address line (person)

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person (address)—address line, text [X(180)]
<i>METeOR identifier:</i>	286620
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 30/09/2005
<i>Definition:</i>	A composite of one or more standard <b>address</b> components that describes a low level of geographical/physical description of a location, as represented by text. Used in conjunction with the other high-level address components i.e. Suburb/town/locality, Postcode—Australian, Australian state/territory, and Country, forms a complete geographical/physical address of a person.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Text
<i>Format:</i>	[X(180)]
<i>Maximum character length:</i>	180

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	<p>A high-level address component is defined as a broad geographical area that is capable of containing more than one specific physical location. Some examples of a broad geographical area are:</p> <ul style="list-style-type: none"><li>- Suburb, town or locality</li><li>- Postcode—Australian or international</li><li>- State, Territory, local government area, electorate, statistical local area</li><li>- Postal delivery point identifier</li><li>- Countries, provinces, etc other than in Australia</li></ul> <p>These components of a complete address do not form part of the Address line.</p> <p>When addressing an Australian location, following are the standard address data elements that may be concatenated in the Address line:</p> <ul style="list-style-type: none"><li>- Building/complex sub-unit type</li><li>- Building/complex sub-unit number</li><li>- Building/property name</li><li>- Floor/level number</li><li>- Floor/level type</li><li>- House/property number</li><li>- Lot/section number</li><li>- Street name</li><li>- Street type code</li><li>- Street suffix code</li></ul> <p>One complete identification/description of a location/site of an address can comprise one or more than one instance of address</p>
-----------------------	--

*Surveillance of Healthcare Associated Infections: SAB and CDI*

line.

Instances of address lines are commonly identified in electronic information systems as Address-line 1, Address-line 2, etc.

The format of data collection is less important than consistent use of conventions in the recording of address data. Hence, address may be collected in an unstructured manner but should ideally be stored in a structured format.

Where Address line is collected as a stand-alone item, software may be used to parse the Address line details to separate the sub-components.

Multiple Address lines may be recorded as required.

*Collection methods:*

The following concatenation rules should be observed when collecting address lines addressing an Australian location.

- Building/complex sub-unit type is to be collected in conjunction with Building/complex sub-unit number and vice versa.
- Floor/level type is to be collected in conjunction with Floor/level number and vice versa.
- Street name is to be used in conjunction with Street type code and Street suffix code.
- Street type code is to be used in conjunction with Street name and Street suffix code.
- Street suffix code is to be used in conjunction with Street name and Street type code.
- House/property number is to be used in conjunction with Street name.

## 6.8 Australian postcode (address)

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Address—Australian postcode, code (Postcode datafile) {NNNN}
<i>METeOR identifier:</i>	429894
<i>Registration status:</i>	Health, Standard 07/12/2011 Community services, Standard 06/02/2012 Early Childhood, Standard 09/03/2012
<i>Definition:</i>	The Australian numeric descriptor for a postal delivery area for an address.

### Value domain attributes

---

#### Representational attributes

<i>Classification scheme:</i>	Postcode datafile
<i>Representation class:</i>	Code
<i>Format:</i>	{NNNN}
<i>Maximum character length:</i>	4

#### Collection and usage attributes

*Comments:* See <http://meteor.aihw.gov.au/content/index.phtml/itemId/429894>.

### Data element attributes

---

#### Collection and usage attributes

*Guide for use:* Australian postal addresses should include a valid postcode. Refer to the Australia Post Address Presentation Standard for rules on presentation and positioning of postcodes on mail.

For a full list of Australian postcodes visit the Australia Post website: [www.auspost.com.au](http://www.auspost.com.au)

This data element may be used in the analysis of data on a geographical basis which involves a conversion from postcodes to the Australian Bureau of Statistics (ABS) postal areas. This conversion results in some inaccuracy of information as postcodes do not have a geographic definition and boundaries are not well defined. However, in some data sets postcode is the only geographic identifier, therefore the use of other more accurate indicators (e.g. Statistical areas - SA) is not always possible.

When dealing with aggregate data, postal areas, converted from postcodes, can be mapped to Australian Statistical Geography Standard (ASGS) codes using an ABS concordance, for example to determine SA1s. For a more advanced concordance, locality, postcode and state, which are all part of an address, used in conjunction can effectively code data to the SA2 level and above in the ASGS.

This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006

Australian Commission on Safety and Quality in Health Care

*Surveillance of Healthcare Associated Infections: SAB and CDI*

*Interchange of client information* standard. Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)
- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable)

*Collection methods:*

Leave Postcode - Australian blank for:

- Any overseas address
- Unknown address
- No fixed address.

Postal addresses may be different from where a person actually resides.

## 6.9 Australian state/territory identifier

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person—Australian state/territory identifier, code N
<i>METeOR identifier:</i>	286919
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 25/08/2005 Housing assistance, Standard 10/02/2006
<i>Definition:</i>	The Australian state or territory where a person can be located, as represented by a code.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Code

## 6.10 Person identifier

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person—person identifier, XXXXXX[X(14)]
<i>METeOR identifier:</i>	290046
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 25/08/2005
<i>Definition:</i>	Person identifier unique within an establishment or agency.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Identifier
<i>Format:</i>	XXXXXX[X(14)]
<i>Maximum character length:</i>	20

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	Individual agencies, establishments or collection authorities may use their own alphabetic, numeric or alphanumeric coding systems. Field should not be blank.
<i>Comments:</i>	Identifier should be a unique code for the person used in that establishment or agency. This data element concept will be replaced by the NEHTA <i>Individual Healthcare Identifiers</i> (IHIs). Information about the IHI is shown below. NEHTA has engaged Medicare Australia to design and build Australia's first national healthcare identification service, to provide the requisite identification service for the people and organisations involved in healthcare across Australia, by way of: <ul style="list-style-type: none"><li>• <i>Individual Healthcare Identifiers</i> (IHIs) to identify all Australian healthcare consumers</li><li>• <i>Healthcare Provider Identifiers - Individual</i> (HPI-Is), to identify individual healthcare providers, such as general practitioners, clinicians, nurses and pharmacists</li><li>• <i>Healthcare Provider Identifiers – Organisation</i> (HPI-Os), to identify healthcare organisations such as hospitals and clinics.</li></ul> Initially, it is assumed that the Individual Healthcare Identifiers (IHIs) and jurisdictional and local system identifiers (including Medical Record Numbers [MRNs] and Unique Patient Identifiers [UPIs]) will coexist. However, in the longer term, IHIs, HPI-Is and HPI-Os are expected to replace these existing, localised identifiers.

## **7 DATA ELEMENTS – CALCULATION OF HAI RATES**

---

This section specifies the following establishment-level data elements used in the calculation of healthcare associated infection rates (see also sections 4.2 and 4.3):

- Number of patient days
- Patient episodes of healthcare associated SAB
- Patient episodes of hospital identified CDI
- Patient episodes of hospital identified CDI – severe disease

## 7.1 Number of patient days

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment—number of patient days, total N[N(7)]
<i>METeOR identifier:</i>	270045
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The total number of days for all patients who were admitted for an episode of care and who separated during a specified reference period.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Total
<i>Format:</i>	N[N(7)]
<i>Maximum character length:</i>	8
<i>Unit of measure:</i>	Day

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	<p>A day is measured from midnight to 2359 hours.</p> <p>The following basic rules are used to calculate the number of patient days for overnight stay patients:</p> <ul style="list-style-type: none"><li>• The day the patient is admitted is a patient day</li><li>• If the patient remains in hospital from midnight to 2359 hours count as a patient day</li><li>• The day a patient goes on leave is counted as a leave day</li><li>• If the patient is on leave from midnight to 2359 hours count as a leave day</li><li>• The day the patient returns from leave is counted as a patient day</li><li>• The day the patient is separated is not counted as a patient day.</li></ul> <p>The following additional rules cover special circumstances and in such cases, override the basic rules:</p> <ul style="list-style-type: none"><li>• Patients admitted and separated on the same date (same-day patients) are to be given a count of one patient day</li><li>• If the patient is admitted and goes on leave on the same day, count as a patient day</li><li>• If the patient returns from leave and goes on leave on the same date, count as a leave day.</li><li>• If the patient returns from leave and is separated, it is not counted as either a patient day or a leave day.</li><li>• If a patient goes on leave the day they are admitted and does not return from leave until the day they are discharged, count as one patient day (the day of admission is counted as a patient day, the day of separation is not counted as a patient day).</li></ul>
-----------------------	---

*Surveillance of Healthcare Associated Infections: SAB and CDI*

When calculating total patient days for a specified period:

- Count the total patient days of those patients separated during the specified period including those admitted before the specified period
- Do not count the patient days of those patients admitted during the specified period who did not separate until the following reference period
- Contract patient days are included in the count of total patient days. If it is a requirement to distinguish contract patient days from other patient days, they can be calculated by using the rules contained in the data element: total contract patient days.

National Health Data Committee

## 7.2 Patient episodes of healthcare associated SAB

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment—number of patient episodes of healthcare associated <i>Staphylococcus aureus</i> bacteraemia, total episodes N[NNNN]
<i>METeOR identifier:</i>	428594
<i>Registration status:</i>	Health, Standardisation pending 23/07/2012
<i>Definition:</i>	The total number of patient episodes of healthcare associated <i>Staphylococcus aureus</i> bacteraemia (SAB) occurring within the organisation during a specified reference period.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Total
<i>Format:</i>	N[NNNN]
<i>Maximum character length:</i>	5

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	<p>Patient episodes of healthcare associated <i>Staphylococcus aureus</i> bacteraemia may be counted for:</p> <ul style="list-style-type: none"> <li>an individual establishment i.e. the sum of the number of patient episodes of healthcare associated SAB within the establishment; and/or</li> <li>a jurisdiction (i.e. state/territory) i.e. the sum of the number of patient episodes of healthcare associated SAB within establishments within the jurisdiction.</li> </ul>
-----------------------	--

SAB rates will be calculated for each healthcare facility and jurisdiction as follows:

Numerator:	Patient episodes of healthcare associated SAB	X 10,000
Denominator:	Number of patient days	

As with all hospital-based infection surveillance, the responsibility for collection, analysis and reporting generally rests with hospital infection control teams. In many states, jurisdictional surveillance units provide support for these activities for at least some hospitals, and relevant manuals and material from such units should be used where appropriate.

#### Source and reference attributes

<i>Submitting organisation:</i>	Australian Commission on Safety and Quality in Health Care (ACSQHC)
<i>Origin:</i>	ACSQHC Healthcare Associated Infection Technical Working Group

## 7.3 Patient episodes of hospital identified CDI

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment—number of patient episodes of hospital identified <i>Clostridium difficile</i> , total episodes N[NNNNN]
<i>METeOR identifier:</i>	428601
<i>Registration status:</i>	Health, Standardisation pending 23/07/2012
<i>Definition:</i>	The total number of patient episodes of hospital identified <i>Clostridium difficile</i> occurring during a specified reference period.
<i>Context:</i>	Admitted patient care and those attending the Emergency Department and outpatients departments

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Total
<i>Format:</i>	N[NNNN]
<i>Maximum character length:</i>	5

### Data element attributes

---

#### Collection and usage attributes

<i>Guide for use:</i>	<p>Patient episodes of hospital identified <i>Clostridium difficile</i> infection (CDI) may be counted for:</p> <ul style="list-style-type: none"> <li>an individual establishment i.e. the sum of the number of patient episodes of hospital identified CDI within the establishment; and/or</li> <li>a jurisdiction (i.e. state/territory) i.e. the sum of the number of patient episodes of hospital identified CDI within establishments within the state/territory.</li> </ul>
-----------------------	---

CDI rates will be calculated for each healthcare facility and jurisdiction as follows:

Numerator	Patient episodes of hospital identified CDI	X 10,000
Denominator	Number of patient days	

As with all hospital-based infection surveillance, the responsibility for collection, analysis and reporting generally rests with hospital infection control teams. In many states, jurisdictional surveillance units provide support for these activities for at least some hospitals, and relevant manuals and material from such units should be used where appropriate.

## **8 STAPHYLOCOCCUS AUREUS BACTERAEMIA (SAB) DATA ELEMENTS**

---

This section specifies the disease-specific data elements for a patient episode of healthcare associated SAB:

- Healthcare associated SAB clinical criteria
- *Staphylococcus aureus* bacteraemia status
- SAB Methicillin susceptibility
- Antibiotic susceptibility (MRSA isolate)
- Antibiotic susceptibility indicator (MRSA isolate)

## 8.1 Healthcare associated SAB clinical criteria

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Patient episode of <i>Staphylococcus aureus</i> bacteraemia —most probable healthcare associated <i>Staphylococcus aureus</i> bacteraemia clinical criteria, code N
<i>METeOR identifier:</i>	388928
<i>Registration status:</i>	Health, Standardisation pending 22/02/2012
<i>Definition:</i>	Most probable clinical criteria for a healthcare associated patient episode of <i>Staphylococcus aureus</i> bacteraemia (SAB) when the patient's first SAB positive blood culture was collected less than or equal to 48 hours after hospital admission, as represented by a code.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Code																
<i>Format:</i>	N																
<i>Maximum character length:</i>	1																
<i>Permissible values:</i>	<table> <thead> <tr> <th>Value</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The patient episode of SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter).</td> </tr> <tr> <td>2</td> <td>The patient episode of SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site.</td> </tr> <tr> <td>3</td> <td>The patient episode of SAB was diagnosed within 48 hours of a related invasive instrumentation or incision.</td> </tr> <tr> <td>4</td> <td>The patient episode of SAB is associated with neutropenia (Neutrophils: less than <math>1 \times 10^9/L</math>) contributed to by cytotoxic therapy</td> </tr> <tr> <td>7</td> <td>Not applicable</td> </tr> <tr> <td>8</td> <td>Unknown</td> </tr> <tr> <td>9</td> <td>Not stated/inadequately described.</td> </tr> </tbody> </table>	Value	Meaning	1	The patient episode of SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter).	2	The patient episode of SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site.	3	The patient episode of SAB was diagnosed within 48 hours of a related invasive instrumentation or incision.	4	The patient episode of SAB is associated with neutropenia (Neutrophils: less than $1 \times 10^9/L$ ) contributed to by cytotoxic therapy	7	Not applicable	8	Unknown	9	Not stated/inadequately described.
Value	Meaning																
1	The patient episode of SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter).																
2	The patient episode of SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site.																
3	The patient episode of SAB was diagnosed within 48 hours of a related invasive instrumentation or incision.																
4	The patient episode of SAB is associated with neutropenia (Neutrophils: less than $1 \times 10^9/L$ ) contributed to by cytotoxic therapy																
7	Not applicable																
8	Unknown																
9	Not stated/inadequately described.																

#### Collection and usage attributes

<i>Guide for use:</i>	<p>A SAB will be considered to be a healthcare associated event if:</p> <p><b>EITHER</b></p> <ul style="list-style-type: none"> <li>➤ the patient's first SAB blood culture was collected more than 48 hours after hospital admission or less than 48 hours after discharge</li> </ul> <p><b>OR</b></p> <ul style="list-style-type: none"> <li>➤ the patient's first SAB blood culture was collected less than or equal to 48 hours after hospital admission and one or more of the following key clinical criteria was</li> </ul>
-----------------------	--

1. SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter)
2. SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site
3. SAB was diagnosed within 48 hours of a related invasive instrumentation or incision
4. SAB is associated with neutropenia (Neutrophils: less than  $1 \times 10^9/L$ ) contributed to by cytotoxic therapy

The most probable healthcare associated clinical criteria should be selected.

If none of these criteria are met, then the SAB will be considered to be community-acquired for the purposes of surveillance.

*Comments:*

To identify whether SABs are healthcare associated or community-acquired, SABs should undergo a standard case review by a healthcare worker trained in Infectious Diseases/Infection Control.

## **9 CLOSTRIDIUM DIFFICILE INFECTION (CDI) DATA ELEMENTS**

---

This section specifies the disease-specific data elements for a patient episode of CDI:

- severe CDI status
- CDI strain

## 9.1 Severe CDI status

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Patient episode of <i>Clostridium difficile</i> infection—severe <i>Clostridium difficile</i> infection status, code N
<i>METeOR identifier:</i>	389393
<i>Registration status:</i>	Health, Standardisation pending 22/02/2012
<i>Definition:</i>	Indicates whether the patient episode of <i>Clostridium difficile</i> infection (CDI) meets the surveillance criteria for severe CDI, as represented by a code.

*Context:*

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Code	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	1	Patient episode of CDI meets the surveillance criteria for severe CDI
	2	Patient episode of CDI does not meet the surveillance criteria for severe CDI
	7	Not applicable
	8	Unknown
	9	Not stated/inadequately described.

#### Collection and usage attributes

*Guide for use:* This data element is used to classify the severity of the patient episode of *Clostridium difficile* infection (CDI). This is an optional data element for those hospitals and jurisdictions undertaking a more intensive form of surveillance.

Collecting this data is recommended for larger hospitals with high risk patient population or high background rates. Classification of severity level supports the use of information for local prevention and control.

CODE 1 Yes

Record if the patient episode of CDI meets the surveillance criteria for severe CDI.

CODE 2 No

Record if the patient episode of CDI does not meet the surveillance criteria for severe CDI

For surveillance, a severe episode of CDI is defined as a CDI patient who meets any of the following surveillance criteria within 30 days of symptom onset:

- history of admission to an intensive care unit for treatment of complications from CDI (e.g. for shock that requires vasopressor therapy);
- history of surgery (e.g. colectomy) for toxic megacolon, perforation or refractory colitis; or
- death caused by CDI within 30 days after symptom onset.

Infection Control and Hospital Epidemiology 28:140-145</p>

## 9.2 CDI strain

### Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Patient episode of <i>Clostridium difficile</i> infection — <i>Clostridium difficile</i> infection strain, X[X(39)]
<i>METeOR identifier:</i>	428320
<i>Registration status:</i>	Health, Standardisation pending 22/02/2012
<i>Definition:</i>	The strain of <i>Clostridium difficile</i> infection (CDI) recorded for the patient episode of <i>C. difficile</i> as reported by the laboratory after identification and typing of the <i>C. difficile</i> specimen, as represented by text.

### Value domain attributes

---

#### Representational attributes

<i>Representation class:</i>	Text
<i>Format:</i>	X[X(39)]
<i>Maximum character length:</i>	40

## Appendix I – Supporting data element concepts

---

### Episode of admitted patient care

#### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	268956
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The period of admitted patient care between a formal or statistical <b>admission</b> and a formal or statistical <b>separation</b> , characterised by only one care type.
<i>Context:</i>	Admitted patient care.
<i>Specialisation of:</i>	Episode of care (Episode of admitted patient care status)

#### Collection and usage attributes

<i>Guide for use:</i>	This treatment and/or care provided to a patient during an episode of care can occur in hospital and/or in the person's home (for <b>hospital-in-the-home</b> patients).
-----------------------	--

#### Source and reference attributes

<i>Origin:</i>	Health Data Standards Committee.
----------------	----------------------------------

### Establishment

#### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	268953
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Institutions, organisations or the community from which health services are provided. The term establishment covers conventional health establishments and also organisations which may provide services in the community.
<i>Specialisation of:</i>	Health service provider (Establishment status)

#### Source and reference attributes

<i>Origin:</i>	National Health Data Committee
----------------	--------------------------------

## Person

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	268955
<i>Registration status:</i>	Health, Standard 01/03/2005 Community services, Standard 01/03/2005 Housing assistance, Standard 01/03/2005
<i>Definition:</i>	A human being, whether man, woman or child.
<i>Specialisation of:</i>	Person/group of persons (Group status)

### Source and reference attributes

<i>Origin:</i>	Macquarie University 2003. <i>The Macquarie Dictionary 3rd ed.</i> Sydney: The Macquarie Library Pty. Ltd

## Address

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	428657
<i>Registration status:</i>	Health, Standardisation pending 24/11/2011 Community Services, Standard 06/02/2012 Early Childhood, Standardisation pending 17/11/2011
<i>Definition:</i>	A collection of information used for describing the location of an entity and / or details describing how the entity can be contacted.

### Source and reference attributes

<i>Submitting organisation:</i>	Australia Institute of Health and Welfare
---------------------------------	---

## Laboratory

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	390761
<i>Registration status:</i>	Standardisation pending
<i>Definition:</i>	A facility that performs tests in various fields of pathology including anatomical pathology (histology and cytology), chemical pathology, microbiology, haematology, immunohaematology, cytogenetics, molecular biology, immunology and assisted reproductive technologies <sup>1</sup> .

### Source and reference attributes

## Patient episode of *Staphylococcus aureus* bacteraemia

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	388775
<i>Registration status:</i>	Standardisation pending
<i>Definition:</i>	A positive blood culture for <i>Staphylococcus aureus</i> bacteraemia (SAB) that arises from an episode of admitted patient care in an Australian hospital and meets the case definition for healthcare associated SAB

### Collection and usage attributes

#### Source and reference attributes

<i>Submitting organisation:</i>	Australian Commission on Safety and Quality in Health Care

## Methicillin-resistant *Staphylococcus aureus* isolate

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	379076
<i>Registration status:</i>	Standardisation pending
<i>Definition:</i>	The methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) strain of <i>Staphylococcus aureus</i> bacteraemia (SAB) that has been isolated.

### Collection and usage attributes

<i>Guide for use:</i>	The MRSA isolate object class is to be used to describe whether the SAB infection is resistant to various antibiotics.
-----------------------	--

## Patient episode of *Clostridium difficile* infection

### Identifying and definitional attributes

<i>Metadata item type:</i>	Object Class
<i>METeOR identifier:</i>	388767
<i>Registration status:</i>	Standardisation pending
<i>Definition:</i>	A patient episode of <i>Clostridium difficile</i> infection (CDI) is a case of diarrhoea that meets the following criteria: the stool sample yields a positive result in a laboratory assay for <i>C. difficile</i> toxin A and/or B, or a toxin-producing <i>C. difficile</i> organism is detected in the stool sample by culture or other means.

### Source and reference attributes

<i>Submitting organisation:</i>	Australian Commission on Safety and Quality in Health Care

## Appendix II – Data Set Specification Terminology<sup>2</sup>

---

### Metadata item types

- Classification scheme - An official terminological system, recognised and endorsed by a national or international body, that is used to classify data.
- Data element - The basic unit of identifiable and definable information created by combining a data element concept and a value domain.
- Data element concept - A concept created for the purposes of defining a data element by the union of an object class and a property.
- Data set specification - A collection of data elements which are collected as a set.
- Object class - Represents an entity, place or event that is of interest and needs to be described.
- Property - A characteristic of the object class of interest.
- Value domain - A set of permissible values by which a data element can be implemented. The value domain may be enumerated (e.g. a code) or non-enumerated (e.g. a total).

### Short name

A short or common name or designation by which the data element is known and might be identified.

### Definition

A concise statement that expresses the essential nature of the metadata item and its differentiation from other metadata items.

### Context

A designation and/or description of the application environment or discipline in which the data element concept has meaning.

---

<sup>2</sup>Australian Institute of Health and Welfare, About Metadata,  
<http://meteor.aihw.gov.au/content/index.phtml/itemId/268284>

**Representation class**

The class of representation of a value domain (e.g. 'Code' or 'Total').

*Table 1: Valid representation class values and their associated meanings*

Value	Meaning
Average	A numeric value representing an arithmetic mean.
Code	A system of valid symbols that substitute for longer values.
Date	A numeric value representing a calendar date (i.e. day, month and year) or recognised part of a calendar date (i.e. day, month, and/or year).
Identifier	A value which establishes identity.
Percentage	Parts per hundred.
Ratio	An expression of the quantity of one substance or entity in relation to that of another (Dorlands, 2003: 1586).
Text	An unformatted, descriptive value.
Time	A numeric value representing a specific instance in time.
Total	A numeric value representing the sum of a set of values or an entire quantity (including monetary).
Count	A numeric value representing a non-monetary numeric value arrived at by counting.
Currency	A numeric value representing a monetary value.
Quantity	A numeric value representing a continuous number such as the linear dimensions, capacity/amount (non-monetary) of an object.

**Format**

A template for the presentation of values, including specification and layout of permitted characters, the maximum and minimum size, and precision. It is not a template for electronic data transmission or storage.

*Table 2: Format values and their associated meanings*

Value	Valid character range
A	Alphabetic character set: contains the letters a-z and A-Z and may contain special characters**, but not numeric characters.
N	Numeric character set: contains whole and decimal numbers and may contain special characters, but not alphabetic characters.
X	Alphanumeric character set: contains alphabetic and numeric characters, and may contain blank characters.
D	A numeric character representing a number of days.*
M	A numeric character representing a number of months.*
Y	A numeric character representing a number of years.*
h	Any numeric character representing a number of hours.*
m	Any numeric character representing a number of minutes.*
s	Any numeric character representing number of seconds.*
{ }	The string within the curly brackets (braces) is optional in its entirety (e.g. X{XX} indicates 1 or 3 alphanumeric characters (i.e. X or XXX)).
[ ]	The string within the square brackets is optional in any ordered combination (e.g. [XXX] indicates 0, 1, 2 or 3 alphanumeric characters (i.e. blank, X, XX or XXX)).
( )	The character preceding the round brackets (parentheses) is repeated the number of times specified (e.g. X(9) indicates 9 alphanumeric characters).

\*\* A special character is a character which has a visual representation and is neither a letter, number, ideogram, or blank. For example, punctuation marks and mathematical symbols.

A blank is a character that represents an empty position in an alphanumeric character field e.g. space. A blank is conceptually different from a null value, which is defined as the absence of a stored value.

\* Valid in value domains of representation class Date or Time only. These format values indicate the valid unit(s) of measure to be presented. For value domains of all other representation classes, only the characters A, N, X, { }, [ ], and ( ) may be used to denote the presence of a value.

**Maximum character quantity**

The maximum number of characters permitted to represent the values.

**Origin**

Any document(s) (including web-sites), organisations or committees from which any content is drawn.
