NIMC with VTE prophylaxis section

Rationale

Venous thromboembolism (VTE) which comprises pulmonary embolism (PE) and deep vein thrombosis (DVT) is a major source of morbidity and mortality for surgical and medical patients in hospital.

In 2008, it was estimated that there were over 14,700 cases of VTE and approximately 5,000 deaths due to VTE in Australia. The estimated financial cost of VTE was in excess of AUD $1.7 billion, with 80% of these costs due to lost productivity as a result of premature death.¹

Most hospitalised patients have one or more risk factors for VTE. Surgery is a well established VTE risk factor and the use of thromboprophylaxis is generally higher among surgical patients than medical patients² however VTE cases in acute care are equally attributable to medical and surgical admissions.³

Studies show that pharmacological prophylaxis (i.e. low dose heparin to all patients above 40-45 years) for patients undergoing most types of surgery is more cost effective than no prophylaxis and results in a reduction in the frequency of fatal pulmonary embolisms.⁴

Despite the frequency with which VTE occurs in hospitalised patients and the well-established efficacy and safety of preventative measures, prophylaxis is often underused or used sub-optimally.

The use of a VTE prophylaxis section in the medication chart to encourage documentation of a VTE risk assessment and ordering of VTE prophylaxis, combined with education, has been shown to increase prescribing of VTE prophylaxis.

Why have a VTE prophylaxis section in the NIMC?

The VTE prophylaxis section has been developed to prompt:

- VTE risk assessment
- VTE pharmacological prophylaxis prescribing
- VTE mechanical ordering.

The section has been placed above the warfarin section to assist with the recognition of patients who are already receiving therapeutic anticoagulation and do not require additional VTE prophylaxis.

Who should document the patient’s VTE risk?

Whoever has responsibility in your hospital for assessing the patient’s VTE risk should sign and date the NIMC which notes that the assessment has been done. In some hospitals this will be done by the admitting medical officer, in others it will be done by the nursing staff. The risk assessment should be completed consistent with local hospital policy.

NIMC User Guide

The Commission has developed a user guide to the NIMC that explains all sections of the chart including information on how to use the VTE section. The NIMC user guide is available at: www.safetyandquality.gov.au/publications/national-inpatient-medication-chart-user-guide-including-paediatric-versions/

Using the VTE prophylaxis section on the NIMC

### Step-by-step guide

**Step 1: Document patient’s VTE risk assessment**
1. Authorised clinician to assess individual patient’s risk for VTE based on their risk factors including the reason for hospitalisation utilising local hospital policy.
2. Assess patient’s risk of bleeding or contraindications to VTE prophylaxis.
3. Formulate an overall risk assessment - risks versus the benefits of VTE prophylaxis.
4. Document if VTE prophylaxis is NOT required or is contraindicated by ticking the appropriate box. Document any contraindications to VTE prophylaxis in the medical record.
5. Document the assessment has been done by ticking the VTE risk assessed box and signing and dating in the field provided.

**Step 2: Order pharmacological VTE prophylaxis**
1. Prescriber to select an appropriate agent if indicated and specify:
   - Route
   - Dose
   - Frequency, and
   - Administration times.
2. Nurse to document the dose given and sign immediately after administration.

**Step 3: Order mechanical VTE prophylaxis**
1. Clinician (nurse or doctor) to order mechanical prophylaxis where appropriate (e.g. compression stockings). Nursing staff may have responsibility for ordering mechanical prophylaxis depending on local hospital policy.
2. Nurse to sign that mechanical prophylaxis is applied and checked.
